

Test E: If there IS 24 VCD across -V and +V then check the DC fuse here.

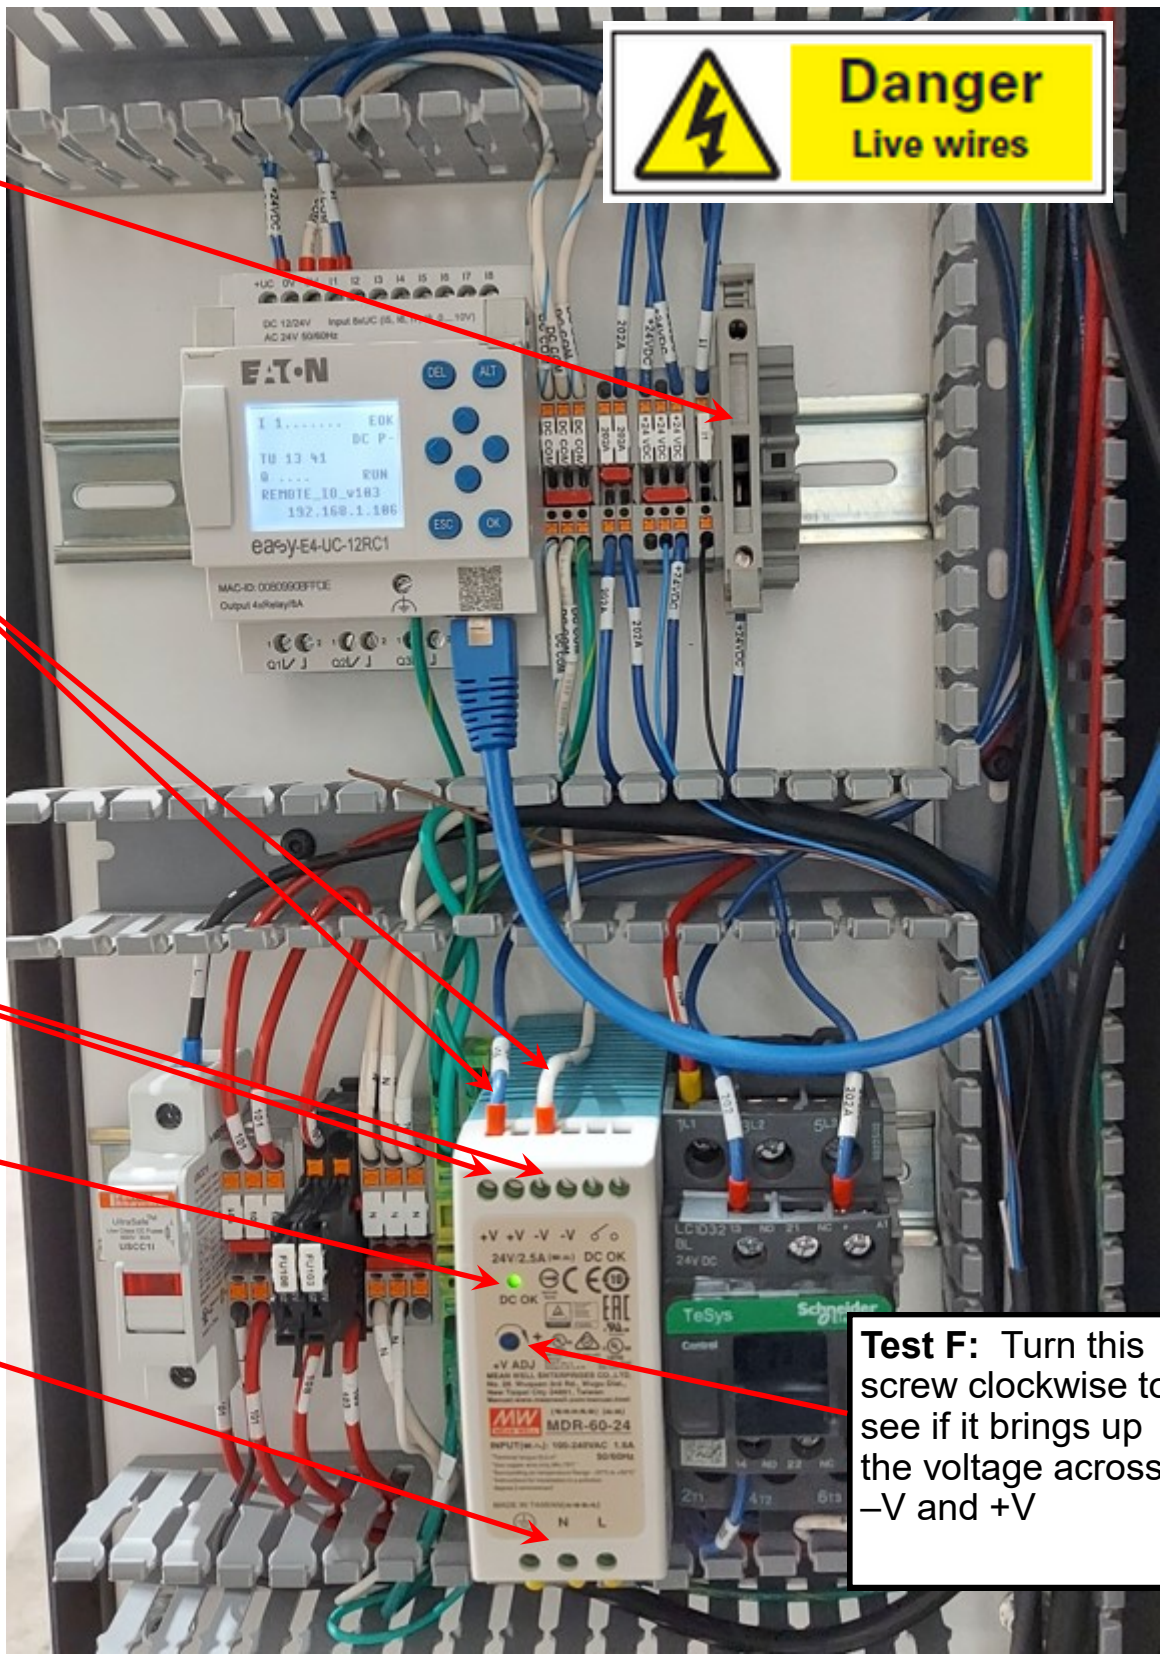

Test D: If there is NOT 24 VDC across -V and +V then remove the two wires and re-test. If there is now 24 VDC across these two terminals then the problem is outside the power supply.

Test C: Is there 24 VDC across -V and +V

Test B: Is the green LED on?

Test A: Is there 120 VAC across L and N on power supply input?

START HERE

Test F: Turn this screw clockwise to see if it brings up the voltage across -V and +V
